

Echo Receptionist

An AI voice receptionist workspace built for a client so local businesses never lose a booking to voicemail. Echo answers the line, qualifies the caller, holds a calendar slot, and writes the CRM.

AI role. Echo is the live front-desk voice. It converses on the call, then uses the end-of-call event to book, text, and log — it is not a chat toy and not a generic image generator.

MOTIVE

Missed calls were costing booked work.

The client needed a receptionist that stays on the line after hours, on the floor, and across five local-business verticals — without hiring a night desk.

01

Voicemail drop-off

Same-day jobs and consults went to voicemail. Callers booked the next business that picked up.

02

No qualified handoff

Staff returned to a name and a number — no urgency, no slot, no CRM note.

03

Split tools

Voice, calendar, SMS, and CRM lived in different places. Follow-through depended on memory.

WHY IT WAS BUILT

Market friction, then a product response.

Friction

- After-hours coverage was a service cost, not a desk.
- Generic IVR could not book a live calendar slot.
- CRM notes arrived late or not at all.
- Urgent callers needed a human transfer, not a form.

Response

- Always-on inbound voice with industry playbooks.
- Live Google Calendar offers — no double-booking.
- End-of-call write-back to GoHighLevel.
- Warm transfer when the playbook flags urgency.

BUSINESS VALUE

Commercial outcomes the desk can measure.

Coverage

24/7 pickup

Every inbound line is answered. After-hours intent is captured instead of lost to voicemail.

Conversion

Booked slots

Open calendar inventory is offered on the call. Confirmations go out by SMS immediately.

Qualification

Scored leads

Sentiment, summary, and stage land on the pipeline so staff start from context, not a callback list.

Operations

CRM completeness

Transcript, tags, and next step write to GoHighLevel when the call ends – not at the end of the day.

Call logs				VOICE INBOX
CALLER	SERVICE	SENTIMENT	OUTCOME	
James Ortega	Medspa consult	Positive	Booked	
Priya Shah	Legal intake	Neutral	SMS sent	
Jordan Hale	HVAC dispatch	Urgent	Transferred	
Maya Chen	Dental consult	Positive	3:30 booked	
Chris Patel	Hours FAQ	Neutral	Completed	

USER JOURNEY

From brief to a live receptionist.

Operators configure the agent once. Echo then runs the same loop on every call: converse, score, act, write back.

1

Brief

Pick an industry playbook. Set hours, services, and coverage rules.

2

Draft

Write greeting, knowledge, and conversation instructions. Publish the agent.

3

Score

Each call lands with sentiment, summary, and a pipeline stage.

4

Voice

Inbound DID or outbound callback. Transfer when urgency is flagged.

5

Ship

Hold a calendar slot, send SMS, sync GoHighLevel. Desk sees it live.

AI LAYER

What the AI does — and how it actually runs.

Echo is a voice agent with light post-call automation. Claims below match the shipped product: live telephony when keys are present, and a full dashboard simulation when they are not.

Answer

Live voice

Conversation runs through Vapi when keys are configured. Echo uses the client greeting and knowledge — it does not invent coverage or prices.

Book

Calendar slots

Google Calendar is read for open inventory. Echo only offers slots that are free.

Qualify

Transcript + score

End-of-call reports supply transcript, summary, and flags. The workspace stores sentiment, stage, and a score.

Automate

SMS • CRM • callback

Twilio texts confirmations. GoHighLevel gets notes. Outbound uses Vapi + Twilio, or queues in demo mode.

FULL PICTURE

What was delivered to the client.

WHAT

A production AI voice receptionist platform: public site, auth, Mission Control, call log, lead pipeline, agent builder, integrations, and Vapi configuration.

STACK

Next.js 14, React 18, TypeScript, Tailwind, Framer Motion, Three.js, HMAC session auth, File-backed stores. Optional Vapi, Twilio, GoHighLevel, Google Calendar.

WHO

Local operators in home services, dental, medspa, legal, and real estate — desks that cannot miss the first call.

CLIENT DELIVERABLE

A live workspace the operator can log into: configure the agent, connect carriers, watch calls, move leads, and run industry playbooks.

Core modules: Mission Control · Call Logs · Lead Pipeline · AI Agent Builder · Integrations · Vapi Configuration.
